

**Amendments to the Specification:**

Please replace paragraph [0028] with the following amended paragraph:

**[0028]** A preferred embodiment of the invention is shown as a drilling guide 10 having a frame 12 as shown in the various views of FIGS. 1-5. The frame 12 is generally L-shaped in that the frame 12 includes a first flange 14 and a second flange 16 positioned relative to each other at a 90° angle. The first flange 14 preferably defines a generally flat, planar rear face 15 and a second flange 16 preferably defines a generally flat rear face 17. A pair of upstanding, elongated spacing ridges 50 are provided along the rear face 17 of the second flange 16 to account for positioning along beveled door edges. The first flange 14 preferably defines a first circular opening 18 surrounded by an annular lip 20 that is configured as an upstanding right-cylindrical section. The annular lip 20 defines a right cylindrical wall 22 on the interior of the opening. It is preferred that the annular lip 20 upstands in a direction opposite that of the rear face 15 so that the rear face 15 remains generally flat. Preferably, the right cylindrical wall 22 defines a first central axis 24 that is generally perpendicular to the plane of the rear face 15 of the first flange 14, as best seen in FIG. 3.
